

Vancouver Control Center DRAFT

This project is a lifecycle replacement of the Dittmer Control Center operational functions within the Dittmer building facility. The new Vancouver Control Center (VCC) enables and supports the Grid Modernization Key Strategic Initiative (KSI), and provides the physical space and supporting infrastructure for the control center, communication, and data required to implement the Grid Modernization Roadmap. The VCC will be a new, purpose-built, seismically resilient, and fully furnished Control Center on the site of the North/South Ampere buildings.
